

Improving multimedia content delivery in CARNet community

Zvonimir Zelenika

Robert Maček

CARNet RDLab

TwoOfUs (tm)

- ◆ Zvonimir Zelenika
- ◆ B.Sc.EE Telecommunications/FER, Zagreb
- ◆ CARNet 1996-2002, some networks, mostly multimedia
- ◆ TrioMedia 1998-1999, multimedia CDs, multimedia webs
- ◆ As of 2000 - Multimedia services in CARNet - CARNet MoD, iTV

TwoOfUs (tm)

- ◆ Robert Maček
- ◆ Allmost B.Sc.EE (final year)
- ◆ Radiocommunications/FER, Zagreb
- ◆ As of 2001 - CARNet Multimedia services
- ◆ Testing and Implementing of media services and technologies

Our work in CARNet

- ◆ Development and implementation of multimedia applications and technologies
- ◆ CARNet Research and Development Laboratory - small competence and development centre for multimedia
- ◆ Implementing multimedia applications since 1994

History...

1994	1995	1996	1997	1998	1999	2000	2001		
RDLab						CARNet MoD			
download	progressive dl		streaming					transport	
MPEG-1		MPEG-1, QT, A		RealMedia MPEG-1		RealMedia, WinMedia MPEG-1, QuickTime		platforms	
		FAST FPS60		Matrox Marvel, Arra VideoOne		Osprey 500WM	Matrox R 2500	production	
1994	1995	1996	1997	1998	1999	2000	2001

We'll talk about transport

- ◆ In the beginning universe was created
- ◆ Transport of multimedia over the Internet is tricky business
- ◆ Internet was made to survive The Bomb, not to transport multimedia
- ◆ QuickTime 1.0 in 1991 brought multimedia to personal computers
- ◆ Also, along came the Internet

First idea...

- ◆ We'll put multimedia files on web server and let people **download** them
- ◆ You needed to download complete file as some headers were at the end of the file (sounds bit oxymoronic)
- ◆ Also web browsers would do the download (HTTP/TCP) and then launch media players by the extension

Second idea

- ◆ We'll move all headers to beginning and teach media players to do the download themselves and be able to show the file before they download it completely
- ◆ If network speed > media bitrate, we'd get uninterrupted stream
- ◆ This was called **progressive download**
- ◆ Again, works over HTTP/TCP

Progressive download

Great idea came around

- ◆ With progressive download we would transfer lots of useless content
- ◆ So, we'll synchronize server and player and deliver the content at the speed of its bitrate
- ◆ Turned out that we would need specialized servers - media servers which would know how to talk to the player

Great idea continued

- ◆ TCP sucks for this purpose - we can survive losing some packages
- ◆ We'll use UDP, and implement "session" on a level above with some thin protocol
- ◆ In the beginning we'd use PNM and XDM, but IETF standardized RTP, RTSP, RTCP both for transport and for control
- ◆ It is called **streaming**

Streaming

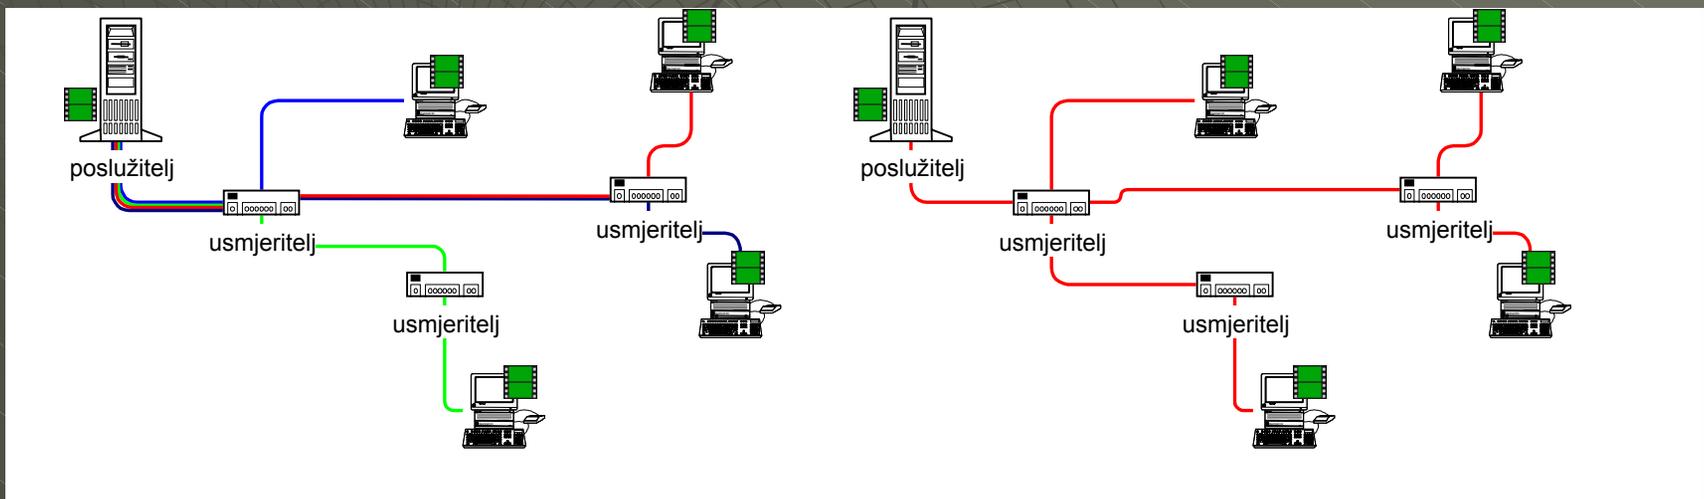

But (there's always but)

- ◆ Every client would connect to a server and pull a separate stream
- ◆ Servers need "big pipes" to be able to serve large audience on high bandwidths
- ◆ Our record: 25Mbps from the server
- ◆ So, the idea of multicast came to be to reduce the load on the servers and the backbone

unicast vs multicast

- ◆ Unicast - every client receives its own stream, clients receive separate streams
- ◆ Multicast - network multiplies the streams, clients join/leave groups receiving the stream

multicast vs unicast

- ◆ Clients join/leave from multicast groups transmitting media streams
- ◆ Network multiplies the streams to every client in the group
- ◆ We need:
 - multicast network
 - multicast enabled clients
 - multicast enabled servers

multicast network

- ◆ We don't have it now, just a testbed
- ◆ It's due to our implementation of the backbone with IP running over ATM AAL5
- ◆ Also due to design of the backbone routers running as LANE, not PVC/SVC
- ◆ There were pros and cons of these solutions, but to gain some things multicast was bit sacrificed

multicast network

- ◆ But new Network is coming - our little pig
- ◆ GiCa - Gigabit CARNet
- ◆ And we're damn sure we'll implement multicast in it (together with many other nice TLAs and FLAs)
- ◆ We'll handle the address space, make applications and solutions

CARNet MoD/TV is ready

- ◆ We have a small testbed multicast network in our lab
- ◆ Our media servers are already talking multicast with unicast rollover for non-multicast clients
- ◆ Windows Media Services 9
- ◆ Apple Darwin Streaming Server
- ◆ still lots to do, but we're getting better

Windows Media Services 9

- ◆ Full Paper with this presentation is obsolete, we moved to next-generation Windows Media Services 9 as primary content-delivery mechanism
- ◆ Supports multicast in Enterprise Edition, we're currently running it on Windows .NET Server 2003 Beta (soon RC1)

Publishing Point

- ◆ More-or-less equivalent to the "program"
- ◆ On Demand or broadcast
- ◆ Only broadcast can be multicasted
- ◆ Description files (almost SDPs) are created to define parameters of the multicast group we transport to
- ◆ Just with mcast we can't properly monitor number of clients connected

Problems

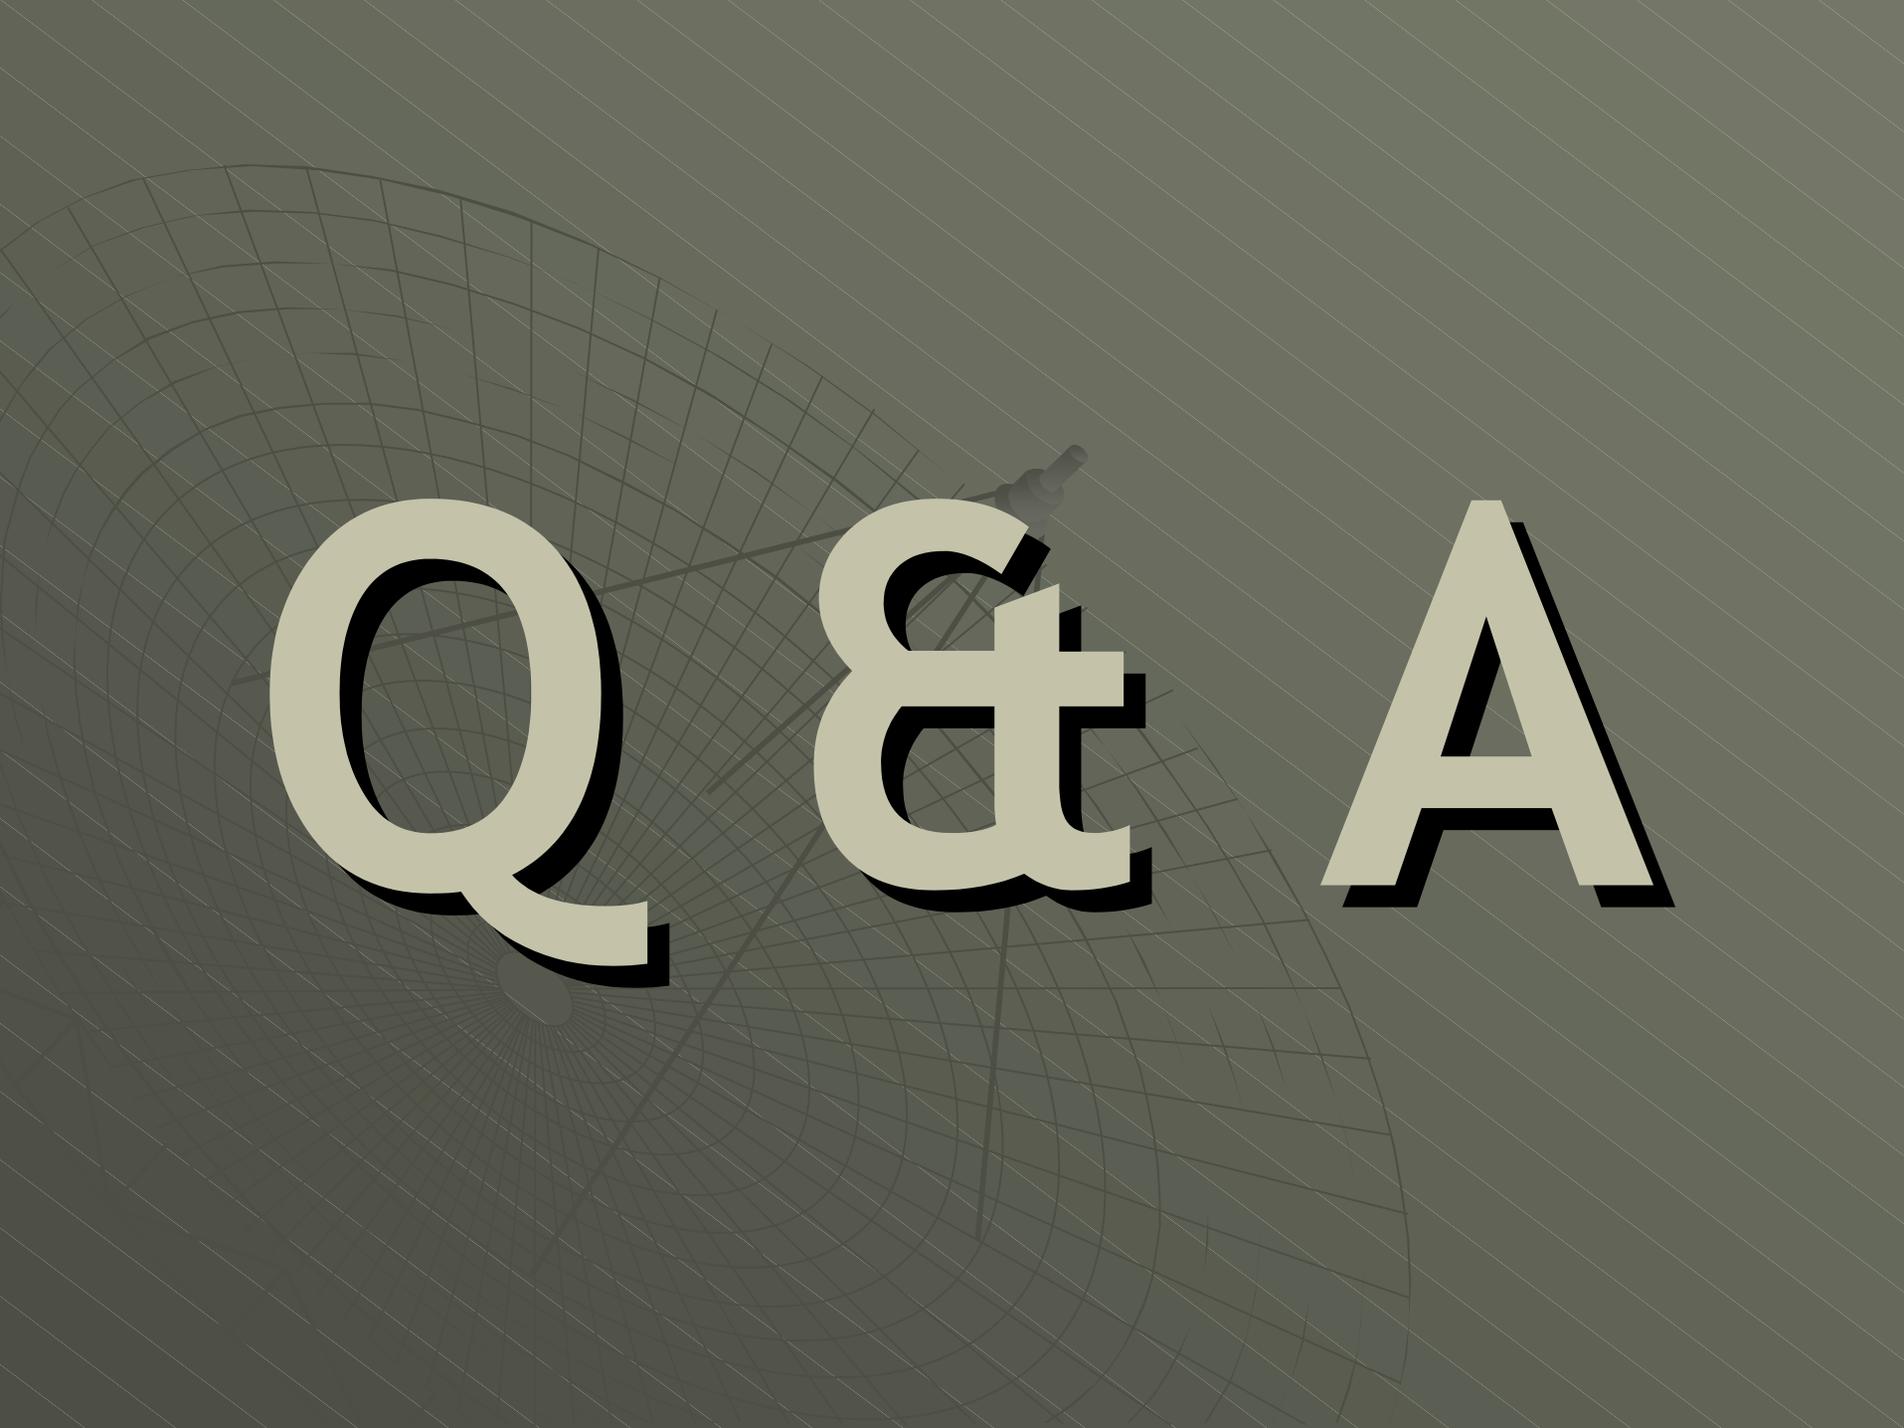

- ◆ Actually people mostly (both around here and in Microsoft/Cisco)
- ◆ Multimedia applications and Network technology are too often observed as two very separate things, though its crucial to cover both of these "layers"
- ◆ Need to use multidisciplinary approach from Layer 1 to Layer 7

Where to go?

- ◆ Our Cisco routers are starting to talk multicast
- ◆ We hope to spread to FERs network (new GBEthernet-based backbone)
- ◆ With new CARNet backbone we'll spread the scope of multicast network until we cover entire network
- ◆ Implement Video Conferencing, Streaming, IP Telephony

Vision

- ◆ **CARNet Video Network**
- ◆ Enable everyone in CARNet community to use multimedia in their work/life for education and entertainment
- ◆ Provide "multimedia infrastructure" capable of supporting all the wildest dreams - on network, applications and services level

Q & A
